# **StepMathAgent**

 $x^2 + y^2 = 9$ ?  $\sqrt[3]{x} + y^2 = 1$ ?

# represented by the following equation is a cylindrical surface: $(x-z)^2+(y+z-a)^2=a^2$ . **Open-ended Problem**

# $y \ge 3$ , find the maximum value of x + 3y.

constraints  $x, y \leq 2, x +$ 

**Calculation Problem** 

If x and y satisfy the

### **Proof Problem** Prove that the surface

(5): Incorrect

M lies.

Define points P and Q, and derive the equation of the surface on which point

#### Based on the constraints, both x and y cannot exceed 2, and x + yy must be greater than or equal to 3. To maximize the value of x +3y, we should increase the value of y because y has a larger coefficient. Since $y \le 2$ , we take y = 2. To satisfy the condition $x + y \ge 3$ , x must be at least 1. Therefore, the optimal solution is

#### 1. Logical Step Segmentation (1) Based on the constraints, both x and y cannot exceed 2, and x + y = 0

x = 1. Then, x + 3y = 1 + 3(2) = 7. [Final answer]: [7]

y must be greater than or equal to 3. (2) To maximize the value of x + 3y, we should increase the value of y because y has a larger coefficient. Since  $y \le 2$ , we take y = 2. (3) To satisfy the condition  $x + y \ge 3$ , x must be at least 1. Therefore, the optimal solution is x = 1.

# (4) x + 3y = 1 + 3(2) = 7. (5) Final answer: [7] 2. Step Scoring

### Validation (1):Correct; (2): Correct; (3): Incorrect; (4): correct-but-meaningless; 3. Score Aggregation
